Owning the lake, not just the rod: The continuing challenge of ‘the old boys’ in knowledge production

Knowledge from the Global South, and particularly Africa, is continuously exported and repackaged, thereby transferring its ownership to those able to conform it to the paradigms of consumption in the knowledge economy of the Global North. The list of the top 40 scientific papers by country, according to Scopus, reflects a significant under-representation of publications from Africa. It is significant to note that only one African country – South Africa – features on the list, but only in the bottom five journals. This exclusion may be for many reasons, not withstanding those related to funding and government support, the developmental needs of universities, a lack of ability on the part of the authors themselves to write to Western paradigms and standards, and the career aspirations and needs of African academics. Yet we propose that these issues are not the only reasons for the lack of academic voice from the African continent – there is a substantial amount of research on inequality in global knowledge production which largely focuses on income and resource inequality as the major reason for this situation. It is, however, arguable that focusing only on the technical and economic limitations of African academics, whilst ignoring the greater cultural and political context within which the practice of academia is in itself deeply entrenched, does not sufficiently account for the challenges that they face. However, a significant cause of academic silence is the consequence of barriers resulting from practices of ‘the old boys’ network’. Thus, focusing on the global publication practices in academia, we present fresh arguments to bring to centre stage the consequences of barriers resulting from these networks. Here, the relative socio-political challenges of African academics are critically interwoven into the understanding and functioning of the informal old boys’ network.

The idea of the ‘old boys’ network’ stems from the British elite school system in which men of influence and means used their status to advance other men from the same school. There is much literature on the ‘old boys’ network’ in numerous sectors. Yet this concept is still elusive and vague and few would openly acknowledge being part of any network that propagates the advancement of individuals from a similar social background. The developmental implications thereof, especially in light of the current prioritisation of the decolonisation agenda in South Africa, are also therefore discussed.

It could equally be argued that the idea of ‘the old boys’ may simply be a consequence of Western academia being the historical core of the university system and, as such, certain academics have mastered the paradigms, systems and language through many cycles of evolution and refinement. However, the oldest university (University of al-Qarawiyyin, Fez) is located in Morocco – on the African continent. This raises the question of why similar cycles of evolution and refinement have not taken place within the African science and higher education context, leading to Morocco’s influence within science and education among the ranks of world-leading scientific outputs. This may critically show that ‘contemporary social, political, economic and cultural practices continue to be located within the processes of cultural domination through the imposition of imperial structures of power’. The systems of academic ratings, credible outputs, journal listings and publication status is set, monitored and regulated almost exclusively by individuals based in the Global North.

The idea of monopolies of power with regard to who actually moderates academic outputs, including journal publications, points to a centre of gatekeeping in the Global North. By consistently maintaining the reins on determining what is accepted, rejected or simply unpublishable, the old boys’ network continues to hold up barriers to prominence on the global knowledge economy by African academics and institutions. The historical legacy of imperialism and colonialism is widely recognised as a barrier to development in Africa, and yet within the knowledge economy little has been done to redress the problems that this former system presents. It is upon Africans during their colonial era, it is upon Africans during their current colonial era (e.g. South Africa) than in others (e.g. Zimbabwe). As the countries similar to the latter conform to the ‘colonial master’s’ standards in their general and academic culture, they seem to fairly slightly better on the international academic arena, which is governed largely by the old boys’ network. Similar situations likely ensue in other parts of the world where regions are currently geographically or politically fragmented as a result of the legacy of colonialism.

Although many colonial inequalities have since been redressed in most African countries to some extent, the stains of the colonial legacy still seem to manifest in the international publishing arena, as a form of mistrust by editors to African authors affiliated with African academic institutions. It appears that all knowledge is often evaluated against ‘expert’ knowledge based on Western scientific paradigms, before it is considered valid and useful, even to a non-Western context. This mistrust expresses itself through various means, such as intense and vigorous checks of native African writing or even the writing of authors of European descent who are affiliated with an African academic institution. To date, European languages remain the languages of power, in spite of the many developments of local journals within the Global South. Thus, the colonial experience inherently continues to shape and influence research and its representation within the reproduction of knowledge in publications. As such, more native African academics come across more negative comments centred on language issues from reviewers, in comparison to their Northern counterparts. According to Sithole, the environment in the Global North for the African scholar is hostile, and is made insecure because, somehow, the African scholar is assumed to need the tutelage even of the most junior scholars from the Global North and it is assumed that their facts (even those originating from the more familiar local Global South context to the scholar) must be checked. This experience is also shared by academics of European descent who are based at African institutions, although to a lesser extent.

One also gets a sense that patronage exists in the selection of a reviewer, as typically with some journals, the editor selects reviewers from an existing pool of members of a journal’s board. Thus, very often, African authors must
